

P/N 902-DVTFILL/Diversion Tube Fill Adapter (Garden Hose)

The Diversion Tube Fill Adapter is a fitting that will allow a direct connection of a garden hose. This adapter has been configured with a standard 34mm Red Cap to fit all Standard Series Diversion Tubes. Each adapter is specified with a quick turn coupler for ease of attaching a garden hose and a ball valve to control back flow.

Start by connecting fill hose and adapter to one end of the diversion tube. Make sure the Red Cap is installed onto the opposite end. Start filling. Once the tube has reached approx half capacity you will need to start purging air from the tube by lightly loosening the Red Cap on the opposite end. Once all air has been purged from the tube you can complete the fill process.

-Caution- Do not over pressure the tube during the fill process. All you are trying to achieve with the fill adapter is increased volume capacity for additional loft. Once the tube has reached its full loft, stop filling, and shut off the ball valve. Your hose can now be disconnected.
